

WHAT IS CLAIMED IS:

1. A delay locked loop comprising:
a delay circuit delaying a first clock to output a second clock;
a detector detecting a phase difference between said first and second
clocks; and

5 a gray code counter using a gray cord, responsive to an output of said
detector for generating a signal adjusting an amount of delay of said delay
circuit.

2. The delay locked loop according to claim 1, wherein said gray
code counter includes:

a gray code register storing said gray code;
a binary code converter converting said gray code into a binary code;
5 an upward carry/downward carry generator using said binary code
stored in said binary code converter, to generate an upward carry signal and
a downward carry signal; and

a carry multiplexer generating from said upward carry signal and
said downward carry signal a carry signal corresponding to a result obtained
10 by said detector, for updating said gray code in said gray code register.

3. The delay locked loop according to claim 2, wherein said delay
circuit includes a fine delay element and a coarse delay element having an
amount of delay greater per unit than said fine delay element, said fine
delay element having an amount of delay adjusted by said binary code
5 stored in said binary code converter, said coarse delay element having an
amount of delay adjusted by said gray code stored in said gray code register.

4. A semiconductor device comprising a delay locked loop
including:

an input buffer receiving an external clock and outputting a first
internal clock;

5 a delay circuit delaying said first internal clock to output a second

internal clock;

a detector detecting a phase difference between said first and second internal clocks; and

a gray code counter using a gray code, responsive to an output of said detector for generating a signal adjusting an amount of delay of said delay circuit.

5. The semiconductor device according to claim 4, wherein said gray code counter includes:

a gray code register storing said gray code;

a binary code converter converting said gray code into a binary code;

an upward carry/downward carry generator using said binary code stored in said binary code converter, to generate an upward carry signal and a downward carry signal; and

a carry multiplexer generating from said upward carry signal and said downward carry signal a carry signal corresponding to a result obtained by said detector, for updating said gray code in said gray code register.

6. The semiconductor device according to claim 5, wherein said delay circuit includes a fine delay element and a coarse delay element having an amount of delay greater per unit than said fine delay element, said fine delay element having an amount of delay adjusted by said binary code stored in said binary code converter, said coarse delay element having an amount of delay adjusted by said gray code stored in said gray code register.

7. The semiconductor device according to claim 5, further comprising an input circuit operative in response to said second internal clock to externally receive a signal.

8. The semiconductor device according to claim 7, further comprising a memory cell array including a plurality of memory cells, wherein said input circuit receives a signal for writing/reading data to/from

said memory cell array.

9. The semiconductor device according to claim 5, further comprising an output circuit operative in response to said second internal clock to externally output a signal.

10. The semiconductor device according to claim 9, further comprising a memory cell array including a plurality of memory cells, wherein said output circuit externally outputs data read from said memory cell array.

11. A semiconductor device comprising a delay locked loop including:

5 a first input buffer receiving at least a first external clock and a second external clock complementary in phase to said first external clock, and outputting a first internal clock at the timing of the rising edge of said first external clock when a potential of said first external clock is equal to that of said second external clock;

10 a second input buffer receiving at least said first and second external clocks, and outputting a second internal clock at the timing of the rising edge of said second external clock when a potential of said first external clock is equal to that of said second external clock;

a first delay circuit delaying said first internal clock to output a third internal clock;

15 a second delay circuit delaying said second internal clock to output a fourth internal clock;

a detector detecting a phase difference between said first and third internal clocks; and

20 a gray code counter using a gray code, responsive to an output of said detector for generating a signal adjusting an amount of delay of said first delay circuit and an amount of delay of said second delay circuit.

12. The semiconductor device according to claim 11, further

comprising an output circuit operative in response to said third and fourth internal clocks to externally output a signal.

13. The semiconductor device according to claim 12, further comprising a memory cell array including a plurality of memory cells, wherein said output circuit is responsive to said third and fourth internal clocks for externally outputting data read from said memory cell array.

14. A control method for a system operating in synchronization with a clock, comprising the steps of:

inputting an external clock to an input buffer to generate a first internal clock therefrom;

5 delaying said first internal clock to output a second internal clock;
 detecting a phase difference between said first and second internal clocks; and

10 using a gray code to determine an amount of delay to be applied in the step of delaying, said amount of delay corresponding to a result obtained in the step of detecting.

15. The method according to claim 14, wherein the step of using the gray code includes the steps of:

converting said gray code into a binary code;

5 using said binary code to produce an upward carry signal and a downward carry signal; and

 referring to a result obtained in the step of detecting, to generate a carry signal from said upward carry signal and said downward carry signal for updating said gray code.

16. The method according to claim 15, further comprising the step of externally outputting data in response to said second internal clock.

17. The method according to claim 15, further comprising the step of externally receiving data in response to said second internal clock.
